Classes

3.1 Referência da Classe MatrixFilesIO

```
#include <Link to MatrixFilesIO.hpp>
```

Métodos Públicos

- MatrixFilesIO (int nMatrixOrder, bool bReadOrWrite, bool bBinaryOrASCII, std::string strFileName)
- virtual ∼MatrixFilesIO ()
- void OperationIO ()
- void OperationIO (Eigen::MatrixXd dMatrixToBeWritten)
- void CreateAndSaveMFile ()
- void ShowMatrix ()

3.1.1 Construtores & Destrutores

3.1.1.1 MatrixFilesIO::MatrixFilesIO (int nMatrixOrder, bool bReadOrWrite, bool bBinaryOrASCII, std::string strFileName)

Este é o construtor da classe de IO para matrizes, MatrixFilesIO. O construtor deve ser utilizado sempre. Uma vez criado um objeto, ele só poderá executar o método específico com o qual foi construído. Vamos falar dos parâmetros então.

Parâmetros

nMatrixOrder	é um inteiro que pede a ordem da matriz que será lida ou salva.
bReadOrWrite	pode tomar os valores READ ou WRITE, que são 0 e 1 respectivamente. isso limite então se
	o objeto servirá para ler dados ou salvá-los.
bBinaryOrASCII	pode tomar os valores BINARY ou ASCII que indica se será salvo ou lido arquivos em binário
	double ou em caracteres ASCII.
strFileName	é o nome do arquivo que será criado ou lido dele.

```
3.1.1.2 MatrixFilesIO::~MatrixFilesIO( ) [virtual]3.1.2 Métodos
```

3.1.2.1 void MatrixFilesIO::CreateAndSaveMFile ()

3.1.2.2 void MatrixFilesIO::OperationIO ()

6 Classes

```
3.1.2.3 void MatrixFilesIO::OperationIO ( Eigen::MatrixXd dMatrixToBeWritten )
```

```
3.1.2.4 void MatrixFilesIO::ShowMatrix ( )
```

Esta função mostra a matriz m dMatrix que é uma matriz lida ou a última matriz salva em arquivo.

A documentação para esta classe foi gerada a partir dos seguintes arquivos:

- · Link to MatrixFilesIO.hpp
- · Link to MatrixFilesIO.cpp

3.2 Referência da Classe NavierStokes

Métodos Públicos

NavierStokes (double dMi=1.0, double dRho=1.0)

3.2.1 Construtores & Destrutores

```
3.2.1.1 NavierStokes::NavierStokes ( double dMi = 1.0, double dRho = 1.0 ) [inline]
```

A documentação para esta classe foi gerada a partir do seguinte arquivo:

Link to NavierStokes.cpp

3.3 Referência da Classe Poisson

```
#include <Link to Poisson.hpp>
```

Métodos Públicos

- Poisson ()
- virtual ∼Poisson ()
- Poisson (Eigen::MatrixXd dBoundaryConditions, Eigen::MatrixXd dNonHomogeneity)
- Eigen::MatrixXd PoissonDirichlet ()
- Eigen::MatrixXd PoissonNeumann ()

3.3.1 Construtores & Destrutores

```
3.3.1.1 Poisson::Poisson( )
3.3.1.2 Poisson::∼Poisson( ) [virtual]
```

3.3.1.3 Poisson::Poisson (Eigen::MatrixXd dBoundaryConditions, Eigen::MatrixXd dNonHomogeneity)

Construtor da classe Poisson É obrigatória a entrada da matriz de condições de contorno, pode ter uma condição inicial na matriz, mas ela será desconsiderada. A matriz de não-homogeneidade é a matriz que segue a equação do lado direito. A equação em questão é a seguinte: $\nabla^2 u = g$

Parâmetros

dNon-	é matriz de não homogeneidade, a função g
Homogeneity	
dBoundary-	contém a condição inicial e de contorno
Conditions	

É importante que as matrizes sejam do mesmo tamanho. Caso contrário o programa será finalizado, com erro. Outro detalhe, as matrizes devem ser quadradas!

3.3.2 Métodos

- 3.3.2.1 Eigen::MatrixXd Poisson::PoissonDirichlet ()
- 3.3.2.2 Eigen::MatrixXd Poisson::PoissonNeumann ()

A documentação para esta classe foi gerada a partir dos seguintes arquivos:

- Link to Poisson.hpp
- Link to Poisson.cpp

```
#include <stdheader.hpp>
#include <NavierStokes.hpp>
```

Componentes

· class NavierStokes

4.8 Referência do Arquivo Link to NavierStokes.hpp

Definições e Macros

- #define VELOCITY X SUM
- #define VELOCITY_Y_SUM
- #define VELOCITY_X_AVERAGE
- #define VELOCITY_Y_AVERAGE
- #define VELOCITY_X_NO_PRESSURE
- #define VELOCITY_Y_NO_PRESSURE

4.8.1 Definições e macros

4.8.1.1 #define VELOCITY_X_AVERAGE

Valor:

```
 \begin{array}{l} \text{0.25*(dVelocityX(i,j)[nTime]+dVelocityX(i-1,j)[nTime]} \\ & + \text{dVelocityX(i,j+1)[nTime]+dVelocityX(i,j+1)[nTime]+dVelocityX(i,j+1)[nTime]} \end{array}
```

This part stands for the average of velocities in the X axis.

$$\mathbf{v}^t = (u^t, v^t)$$

The 't' stands for nothing special

$$u_{ij}^{t} = \frac{1}{4}(u_{ij} + u_{i-1j} + u_{i-1j-1} + u_{ij+1})$$

4.8.1.2 #define VELOCITY_X_NO_PRESSURE

Valor:

This part stand for the velocity obtained by Navier Stokes equation without considering the pressure

$$u_{ij}^* = \left[\frac{\mu}{\rho} \left(\frac{u_{ij}^s - 4u_{ij}}{\Delta x^2}\right) + \frac{f_{x,ij}}{\rho} - u_{ij} \frac{u_{i+1j} - u_{i-1j}}{2\Delta x} - v_{ij}^t \frac{u_{ij+1} - u_{ij-1}}{2\Delta x}\right] \Delta t + u_{ij}$$

4.8.1.3 #define VELOCITY_X_SUM

Valor:

This part stands for the sum of velocities in the X axis.

$$\mathbf{v}^s = (u^s, v^s)$$

The 's' stands for 'sum'

$$u_{ij}^s = u_{i+1j} + u_{i-1j} + u_{ij+1} + u_{ij-1}$$

4.8.1.4 #define VELOCITY_Y_AVERAGE

Valor:

This part stands for the average of velocities in the X axis.

$$\mathbf{v}^t = (u^t, v^t)$$

The 't' stands for nothing special

$$v_{ij}^{t} = \frac{1}{4}(v_{ij} + v_{i-1j} + v_{i-1j-1} + v_{ij+1})$$

4.8.1.5 #define VELOCITY_Y_NO_PRESSURE

Valor:

This part stand for the velocity obtained by Navier Stokes equation without considering the pressure

$$v_{ij}^* = \left[\frac{\mu}{\rho}\left(\frac{v_{ij}^s - 4v_{ij}}{\Delta x^2}\right) + \frac{f_{y,ij}}{\rho} - u_{ij}^t \frac{v_{i+1j} - v_{i-1j}}{2\Delta x} - v_{ij} \frac{v_{ij+1} - v_{ij-1}}{2\Delta x}\right] \Delta t + v_{ij}$$

4.8.1.6 #define VELOCITY_Y_SUM

Valor:

This part stands for the sum of velocities in the Y axis.

$$\mathbf{v}^s = (u^s, v^s)$$

The 's' stands for 'sum'

$$v_{ij}^s = v_{i+1j} + v_{i-1j} + v_{ij+1} + v_{ij-1}$$

4.9 Referência do Arquivo Link to OwnMath.hpp

#include <stdheader.hpp>

Funções

- dMatrix dReadConditions (char strFile[])
- dMatrix PoissonDirichlet (dMatrix dNonHomogeneity, dMatrix dBoundaryConditions)
- void fileName (char *file)
- void save (char file[], clock_t tStart, time_t *inicio, MatrixXd U, string equation)
- void saveTmEqn (char file[], clock_t tStart, time_t *inicio, string equation, MatrixXd *U, int N)

4.9.1 Funções

4.9.1.1 dMatrix dReadConditions (char strFile[])

The method is made to read a matrix of doubles from an ASCII file It requires the number of columns and lines It will check if the read matrix is of right size

Parâmetros

strFile[]	is the name of text file
-----------	--------------------------

Retorna

dMatrixRead is returned, with the contents of the file

4.9.1.2 void fileName (char * file)

Method for creating a file name according to matrix size

Matrix size is not a parameter of function, it is set as a global variable

Parâmetros

strFile	is a char pointer where the string will be saved

Retorna

No return value.

4.9.1.3 dMatrix PoissonDirichlet (dMatrix dNonHomogeneity, dMatrix dBoundaryConditions)

Method to solve the poisson equation by a sparse method

Parâmetros

dNon-	is the non homogeneity in the right-hand side of poisson equation
Homogeneity	
dBoundary-	contains the boundary and initial conditions
Conditions	

Retorna

dPoissonSolution is returned

4.9.1.4 void save (char file[], clock_t tStart, time_t * inicio, MatrixXd U, string equation)

Method for saving a matrix in a file .m After save, it is possible to open easily with octave and print the graph for file

Parâmetros

file[]	name of file where matrix will be save	
tStart	has the value of cpu time in the start, in this method the "tFinal" is calculated and subtracted	
	from tStart	
*inicio	is a pointer that indicates the time of start, and date	
U	is the matrix that will be saved	
equation	is a string that receives the equation being solved, just to show in the .m file. Ex: Laplace	
	Equation - $u_xx + u_yy = f(x,y)$	

Retorna

No return value.

4.9.1.5 void saveTmEqn (char file[], clock_t tStart, time_t * inicio, string equation, MatrixXd * U, int N)

Method for saving various matrices in a file .m After save, it is possible to open easily with octave and make a video of the matrices

Not implemented yet

Parâmetros

file[]	name of file where matrix will be save	
tStart	has the value of cpu time in the start, in this method the "tFinal" is calculated and subtracted	
	from tStart	
*inicio	is a pointer that indicates the time of start, and date	
equation	is a string that receives the equation being solved, just to show in the .m file. Ex: Laplace	
	Equation - $u_xx + u_yy = f(x,y)$	
*U	is a pointer to the 3d matrix U, that will be saved	
N	indicates how many two-dimensional matrices there are in matrix U	

Retorna

No return value.
